

## 1. Requirements List

1. Students can submit service requests.
2. Students can enter a request title and description.
3. The system stores the request date and status.
4. Staff members can view all requests.
5. Staff members can update request status.
6. Request status can be Pending, In Progress, or Done.
7. Users can view request details.
8. The system validates required fields.
9. Students can see their submitted requests.
10. Staff can search requests by status.
11. The system should display requests in a list.
12. The system should prevent empty submissions.
13. Each request should have a unique ID.
14. The system should allow status tracking.
15. The interface should be simple and easy to use.

## 2. User Roles

| Role    | Description                         |
|---------|-------------------------------------|
| Student | Creates and views service requests  |
| Staff   | Reviews requests and updates status |

## 3. Use case

### USE CASE 1 — Submit Request

| Field           | Description                                                                                                    |
|-----------------|----------------------------------------------------------------------------------------------------------------|
| Use Case Name   | Submit Service Request                                                                                         |
| Actor           | Student                                                                                                        |
| Trigger         | Student clicks “Submit Request”                                                                                |
| Main Flow       | 1. Open form<br>2. Enter information<br>3. Submit form<br>4. System validates data<br>5. System stores request |
| Success Outcome | New request is created successfully                                                                            |

### USE CASE 2 — View Request List

| Field           | Description                                                                      |
|-----------------|----------------------------------------------------------------------------------|
| Use Case Name   | View Request List                                                                |
| Actor           | Student / Staff                                                                  |
| Trigger         | User opens request page                                                          |
| Main Flow       | 1. User accesses page<br>2. System retrieves requests<br>3. System displays list |
| Success Outcome | User can view all requests                                                       |

### USE CASE 3 — View Request Details

| Field           | Description                                                                         |
|-----------------|-------------------------------------------------------------------------------------|
| Use Case Name   | View Request Details                                                                |
| Actor           | Student / Staff                                                                     |
| Trigger         | User selects a request                                                              |
| Main Flow       | 1. User clicks request<br>2. System retrieves details<br>3. System displays details |
| Success Outcome | User can view request details                                                       |

### USE CASE 4 — Update Request Status

| Field           | Description                                                                                                |
|-----------------|------------------------------------------------------------------------------------------------------------|
| Use Case Name   | Update Request Status                                                                                      |
| Actor           | Staff                                                                                                      |
| Trigger         | Staff changes request status                                                                               |
| Main Flow       | 1. Staff opens request<br>2. Selects new status<br>3. System validates status<br>4. System updates request |
| Success Outcome | Request status updated successfully                                                                        |

## 4. SRP Class Responsibility Table

| Class Name        | Responsibility              | Reason to Change         |
|-------------------|-----------------------------|--------------------------|
| Request           | Stores request data         | Request fields change    |
| RequestRepository | Handles database operations | Database/storage changes |

|                   |                        |                         |
|-------------------|------------------------|-------------------------|
| RequestService    | Applies business rules | Business rules change   |
| RequestValidator  | Validates user input   | Validation rules change |
| RequestController | Handles request flow   | Routes/actions change   |
| ViewRenderer      | Renders HTML views     | UI rendering changes    |

## 5. MVC Mapping Table

| Item               | MVC Layer  | Why                      |
|--------------------|------------|--------------------------|
| Request            | Model      | Stores request data      |
| RequestRepository  | Model      | Accesses database        |
| RequestService     | Model      | Contains business logic  |
| RequestController  | Controller | Handles application flow |
| requests/index.php | View       | Displays request list    |
| requests/show.php  | View       | Displays request details |

## 6. MVC Mapping Table

| Item               | MVC Layer  | Why                      |
|--------------------|------------|--------------------------|
| Request            | Model      | Stores request data      |
| RequestRepository  | Model      | Accesses database        |
| RequestService     | Model      | Contains business logic  |
| RequestController  | Controller | Handles application flow |
| requests/index.php | View       | Displays request list    |
| requests/show.php  | View       | Displays request details |

## 9. Reflection

1. Which parts are Model, View, and Controller?

The Model handles data and business logic. The View displays information to users. The Controller connects Models and Views and manages user requests.

2. Where should validation happen, and why?

Validation should happen in the Validator or Service layer because it keeps the system organized and prevents invalid data from entering the application.

3. What would break if SQL was placed inside a View?

The View would become difficult to maintain and would mix presentation with database logic, violating SRP and MVC principles.

4. What code do you expect to write next week?

Next week, I expect to implement routing, database operations, controllers, and dynamic HTML views to make the application functional.

10. GitHub Submission Structure
